## N1000A internal precision timebase specifications (Option PTB)

The *N1000A Internal Precision Timebase Specifications* are for Option PTB, which is the N1000A internal precision timebase. These specifications refer to the signal input to the front-panel **Precision Timebase Input** connector.

**NOTE:** If **Freerun** trigger mode is *not* used, a trigger input *must* also be supplied. This is in addition to the reference clock input to the front-panel **Precision Timebase** connector. The trigger input must be synchronous to the reference clock but may be a sub-rate of the clock based on the required frequency range for the trigger input.

Item	Description
Maximum Input Signal	1.3 Vpp
Input DC Offset Range	± 200 mV
<p><b>Input Signal Type</b>                      The internal precision timebase works with typical digital clock signals, such as a BERT output, as well as sine waves. If the rise time or fall time of the clock signal is less than 15% of the period of the clock (for example, less than 15 ps for a 10 GHz clock), reduce the edge speed by using an external low-pass filter or length of cable. For the lowest jitter, use a signal that is as close as possible to the maximum signal amplitude (1.3 Vpp) and minimize any sub-harmonics.</p>	
<p><b>Jitter (Input ≥ 750 mVpp, sinusoidal) (Characteristic)</b></p>	
2.4 GHz to <4.0 GHz trigger (tested at 2.4 GHz, 750 mVpp)	≤ 200 fs rms < 400 fs rms, with 54XXX, 8348X, or N1045A ( <i>non Option LOJ</i> ) module
4 GHz to 9.0 GHz trigger (tested at 5 GHz, 750 mVpp)	≤ 120 fs rms < 400 fs rms, with 54XXX, 8348X, or N1045A ( <i>non Option LOJ</i> ) module
>9.0 GHz to 44.0 GHz trigger (tested at 10, 20, and 40 GHz, 500 mVpp)	≤ 90 fs rms < 200 fs rms, with 54XXX, 8348X, or N1045A ( <i>non Option LOJ</i> ) module

## Module SIRC Filters

System Impulse Response Correction (SIRC) filters provide channel SIRC measurement and data files to give an ideal channel response. SIRC data can be applied in FlexDCA's System Impulse Response Correction dialog. The SIRC correction data feature is a digital filter that is used to:

- Improve the response of module reference filters to more closely match an ideal receiver.
- Enable non-standard reference receiver rates or bandwidths.
- Increase the bandwidth of the channel by up to 50%.
- Ensures that an eye diagram will look identical between different modules.

SIRC correction data is unique to a specific 86116C's serial number. The data can be purchased with new modules or purchased separately for your existing modules. Purchasing data for an existing module requires that the module be returned to Keysight Technologies. SIRC data is downloaded from Keysight.com. To order SIRC data, contact your Keysight representative or visit <http://www.keysight.com/Find/FlexDCA>.

**NOTE:** The SIRC filter ranges shown in the following tables are only available with option IRC and compliance is not guaranteed.

## 54754A TDR system specifications

Normalized information is a characteristic, not a specification. The information is presented here for comparison purposes only. Normalization characteristics are achieved only with the use of the TDR calibration using the firmware routines. Rise time is measured in the Averaged Display mode with best flatness on (default in TDR mode). The rise time of the generator is less than 35 ps, as calculated by:

$$t_{r,\text{system}} = \sqrt{(t_{r,\text{generator}})^2 + (t_{r,\text{scope}})^2}$$

**NOTE:** Flatness is measured in the Averaged Display mode with best flatness on (default in TDR mode).
